1.0 INTENT

The Purpose of this document is to analysis & design of Grinding & Classification (3220) - Ball Mill Foundation.
The dimensions and reinforcement are to be calculated. The report describes the methodology and the design parameters used in the design calculation. The analysis & design is carried out in accordance with project specifications , codes & standards.

2.0 SCOPE

The analysis of the Ball Mill Foundation has been carried by conventional method & Software analysis method as mention.

1. Excel - For Conventional Method.
2. STAAD Pro - For Static Analysis & Strength Calculation
3. ANSYS - For Steady State Dynamic Analysis

As per PMC's comments we prepared two STAAD model generated by plate & solid element. One STAAD model is prepared for lower bound of subgrade modulus (Ks/1.5) & anather is prepared for upper bound of subgrade modulus (Ks*1.5)

Base Pressure check has been done by conventional method in the excel sheet & also check from the result of two STAAD model.
For member strength calculation, force values are also taken from the output result of two STAAD model & designed in the standard excel sheet.

The Steady State Dynamic Analysis of Ball Mill Foundation given as ATTACHMENT-1
Isometric views of STAAD model generated by plate & solid element are attached in Appendix-C

3.0 DESIGN REQUIREMENTS

3.1 REFERENCE

Reference is made in this standard as indicated in STRUCTURAL ENGINEERING DESIGN CRITERIA (MD-216-1000-EG-ST-CRT-1001-A02) , Structural Design Criteria - Process Building & Structures (Doc. No. MD-101-SMEM-EG-ST-CRT-1001) & Civil Design Criteria - General (Doc. No. MD-101-SMEM-EG-CV-CRT-1001).
The latest issues, amendments and supplements to these documents shall apply unless otherwise indicated.

3.2 Design Loads

All Design Loads are indicated in Foundation Load Plan (Doc. No. MD-216-3220-EG-ME-GAD-1002) attached in Appendix A.

1. Self Weight (SW)
2. Dead Load (DL)
3. Drive Load Forward (DRV_F)
4. Drive Load Reverse (DRV_F_REV)
5. Charge Load (CHARGE)
6. Charge Load Reverse (CHARGE_REV)
7. Startup Forward (STARTUP_F)
8. Inching Forward (INCH_F)
9. Inching Reverce (INCH_R)
10. Seismics Load in X-direction (SL_X)
11. Seismics Load in Z-direction (SL_Z)
12. Erection Load (ERECTION)

3.4 Permissible Design Limits

3.4.1 For Static Condition

(i) Eccentricity of the machine foundation is kept within 5%.
(ii) Max. Base Pressure is kept within 50% of the allowable bearing pressure.

PROPRIETARY & CONFIDENTIAL

The contents of this document are the sole property of Outotec Oyj. Any rights not expressly granted herein are reserved. Reproduction, transfer or distribution of part or all of the contents in any form without the prior written permission of Outotec is prohibited.

This document is the property of LARSEN & TOUBRO and must not be passed on to any person or body not authorized by us to receive it nor be copied or otherwise made use either in full or in part by such person or body without our prior permission in writing.

3.4.2 For Dynamic Condition

(i) The fundamental natural frequancy is kept greater than 2 times the frequency of the disturbing force.
(ii) Net horizontal amplitude at top of the foundation is kept within 0.2 mm.
(iii) Max. Base Pressure is kept within the allowable bearing pressure.
(iv) All over the foundation systen min. reinforcement provided is more than 50 Kg/m^3

4.0 Foundations Design Reference & Parameters

4.1 Reference Codes & Books

(i) SBC - 304 CR - 2018
(ii) ACI 318M.
(iii) ACI SP-17M(09)
(iv) ACI 351.3R-18
(iv) HAND BOOK OF MACHINE FOUNDATION - Srinivasulu & V.Vaidyanathan

4.2 Materials

A. Concrete Strength of 28 days

4.2.A.(i) Foundation and Structural Members: 35 MPa
4.2.A.(ii) Blinding Concrete below foundation bases: 15 MPa

B. Reinforcement Grade

4.2.B.(i) Deformed Bar : ASTM A 615 / A 615M Grade 60 (fy = 420MPa)
4.2.B.(ii) Welded Wire Fabric : ASTM A 185(Plain) / A 497(Deformed)

4.3 Grouting

Grout shall be 50 mm cementitious of Strength 40 MPa.

4.4 Minimum Reinforcing Steel (Rebar) Size

The minimum rebar size for use as tension, compression reinforcement shall be 16 mm, except where welded wire fabric is used.

4.5 Minimum Concrete Cover

Concrete Exposure	Member	MinimumCove (mm)
Exposed to Soil	Foundation and Column	75
Exposed to Weather	Column	75

4.6 Allowable Soil Bearing Capacity

The net safe bearing capacity of soil for foundations design as obtained from page 39 of Doc. No. MD-216-0000-EM-GM-RPT-0003 is 670 KN/m2 at 1.2m depth below FGL
The net safe bearing capacity of soil as per **approved** L&T soil test report (Table-6 of Doc. No. MD-216-3000-EG-CV-RPT-1008-A02) is 1300 KN/m2 at 2.5m depth below FGL
However, for safe side we have considered Net Safe Bearing Capacity at founding level as 670 KN/m2.

4.7 Vertical Modulus of Subgrade Reaction (Ks)

As per approved L&T GEOTECHNICAL REPORT (Table-6 of Doc. No. MD-216-3000-EG-CV-RPT-1008-A02) Vertical Modulus of Subgrade Reaction (Ks) at 2.5m depth below FGL is 117,000 kN/m^2/m
As per PMC's comments we prepared two STAAD model generated by plate & solid element. One STAAD model is prepared for lower bound of subgrade modulus (Ks/1.5 = 78000 kN/m^2/m) & anather is prepared for upper bound of subgrade modulus (Ks*1.5 = 175500 kN/m^2/m)

Base area of Raft Foundation = 293.468 m^2
x = 8.397 m
y = 12.56 m

5.3 Check for Eccentricity for Foundation System

Eccentricity in X-direction = (8.397 - 8.459) / 17.968 X 100 = 0.35 % < 5 % **O.K.**
Eccentricity in Y-direction = (12.818 - 12.56) / 24.953 X 100 = 1.03 % < 5 % **O.K.**

5.4 Check for Natural Frequency

5.4.1 Check for natural frequency as per Barkan's method

Design Parameters:

The moment of inertia (Iy) of the base area about the axis passing through its C.G. and perpendicular to the plane of vibration

Iy = 6313.82 m^4

The mass moment of Inertia (φ_y) of the whole system about the 'Y' axis passing through the common C.G and perpendicular to the plane of vibration

$\varphi_y = 1/12*(\Sigma mi(lxi^2+lzi^2)) + \Sigma mi(xoi^2+zoi^2)$
= 18337.93 t-m.Sec2

The mass moment of Inertia (φ_o) about the axis passing through the centroid of the base area and perpendicular to the plane of vibration

$\varphi_{oy} = \varphi_y + mz^2$
= 35803.8 t-m.Sec2

The Ratio (α_y) is given by, $\alpha_y = \varphi_y / \varphi_{oy}$ = 0.512

Loading Notes

1. This drawing must be read in conjunction with Outotec Foundation Specification FS001 and FS002.
2. Foundation design is the responsibility of L&T Civil Engineering. The foundation outline shown on this drawing is indicative only. For dimensions and details on the foundation, outlines that should be maintained, refer to the Foundation Plan View drawing.
3. All loads are positive in the direction of the load arrows. Z is positive down.
4. Direction of rotation: CW = Clockwise seen in the same direction as the X-axis load arrow
   CCW = Counterclockwise seen in the same direction as the X-axis load arrow
5. When lubrication system is OFF and the mill stationary, the bearing housing exerts a horizontal force of 75.23 kN on the concrete
6. Elevation of shear load dimensions are provided with respect to the local underside of baseplate level.

1.0 SCOPE

This specification covers the design of mill foundations and is intended to provide complimentary advice to the project specification foundation drawings.

Both gear and gearless driven mills are described herein. Where applicable, subsections specific to each drive type are included.

For the purposes of this specification the following definitions shall apply:

Outotec: the Mill Supplier
Engineer: the Mill Foundation Designer

2.0 FOUNDATION LOAD DRAWING

This section is intended to provide additional detail to help understand the Foundation Load Drawing.

2.1 The table within the Foundation Load Drawing summarises all loads acting on the foundations from the mill, the charge, the drive train and seismic conditions.

All loads caused by the mill, the charge, the drive train and seismic conditions have been separated and are displayed in columns across the table. Each load is broken down into forces acting in the X, Y and Z axis, acting at each of the main mill support bearings and pinion bearings, which are displayed in rows down the table. The details of how these forces should be applied to the foundations is described in Section 4.2.

Gear Driven
The Drive Loads and Charge Loads both contain a continuous load component and a dynamic load component. The continuous component is displayed in the left column of each of the two load columns and the dynamic component in the right.

Gearless Motor Driven
The Charge Loads contain a continuous load component and a dynamic load component. The continuous component is displayed in the left column and the dynamic component in the right.

2.2 All of the loads defined in the load table on the Foundation Load Drawing are Primary Loads, with no safety factor applied, so as to be suitable for use in combination using methods defined by local design standards.

The Engineer must apply the requirements of the applicable civil and structural standards for foundation design.

2.3 The Seismic force is calculated by multiplying the fully loaded mill weight by the Seismic acceleration co-efficient. The mill loadings are based on a seismic acceleration coefficient of 0.1 m/s^2 unless otherwise stated.

2.4 Forces in the Dead Loads column include self weight only excluding charge or drive related forces; whereas all forces listed in other columns are live loads. In the case of live load columns the dynamic component of the live load, if applicable, is listed in a ”fraction” type fashion adjacent to the steady state component of that live load. The dynamic load range is determined by:

1. the steady state component added to the denominator of the adjacent fraction to
2. the steady state component added to the numerator of the adjacent fraction.

2.5 The loads are separated into the X, Y and Z axis, which are defined as positive in the following directions:

- X axis is horizontal and parallel with the mill centre line and is positive in the direction from the feed end to the discharge end.
- The Y axis is horizontal and perpendicular to the mill centre line and is positive in the direction from the left pinion bearing to the right, when looking at the mill from the feed end.
- The Z axis runs vertically and is positive in the direction from the top of the foundations into the strata.

2.6 There are a number of significant load cases which can occur during operation of the mill, these are made up of a combination of individual loads which can be separated and defined. These load cases are defined as follows:

- The Stationary Mill, Empty load case occurs as the mill is stationary with no charge.
- The Stationary Mill, Design Charge load case occurs when the mill is stationary, filled with the design charge.

- The Normal Operation load case occurs when the mill is filled with the design charge and rotating in steady state at design rotation speed.
- The Startup Forward Direction load case occurs when the mill is filled with the design charge and accelerated from stationary to operating rotation speed in the forward rotation direction.
- The Startup Reverse Direction load case occurs when the mill is filled with the design charge and accelerated from stationary to operating rotation speed in the reverse rotation direction.
- The Inching Forward load case occurs when the mill is filled with design charge and inched in the forward rotation direction.
- The Inching Reverse load case occurs when the mill is filled with design charge and inched in the reverse rotation direction.
- The Seismic load case occurs when the mill is stationary filled with the design charge during a seismic event. Although it is likely that the mill will be under normal operation during a seismic event, in most cases the addition of the drive load will reduce the total load on the main bearings and it is therefore considered conservative to model the seismic load case excluding the drive load.

Loads under each load case in the foundation loading table occur concurrently with the exception of the seismic load and dynamic components of the charge load.

The seismic loads listed in the table are the maximum values for each location & direction and therefore cannot be applied concurrently. The components of the seismic load listed in the table occur as follows:

- Lateral Y, occurs concurrently at free and held bearings (summing the lateral Y for the free and held bearings gives the total seismic base shear).
- Axial X, occurs only at the held bearing (this is the total seismic base shear) if the lube system is energized
- Axial X occurs at both the held and free end bearing piers if the lube system is off noting the value for the free end pier is a small portion of the held end pier to reflect the worst case axial load carried due to friction between the journal and bearings.
- OR a combination of the Y and X directions ensuring the resultant of the components does not exceed the total seismic base shear and the value in each direction and at each location does not exceed the associated value for that location in the loading table.

The total dynamic charge load as applicable to each bearing housing is listed in both the lateral Y and vertical Z directions. This total load cannot occur concurrently in both directions so modeling must consider the worst case scenario resultant from just one of the following loadings:

- Lateral Y, the dynamic force may be applied entirely in the Lateral Y direction.
- Vertical Z, the dynamic force may be applied entirely in the Vertical Z direction
- A combination of the Y and Z directions ensuring the resultant of the components does not exceed the value listed in either the lateral or vertical rows of the table.

The Drive Load – Startup, Operation and Motor Short Circuit (Gearless mill drives only) applied to the main bearing housings should be applied in either the lateral Y or vertical Z directions, or any combination of the two directions ensuring the resultant of the components does not exceed the value listed in either the lateral or vertical rows.

The Drive Load – Startup, Operation and Motor Short Circuit (Gearless mill drives only) applied to the stator supports should be applied in the lateral Y and vertical Z directions concurrently.

2.7 Each load case is a made up of a combination of individual loads, as displayed across the top of each column in the load table. These loads are defined as follows:

- The Dead Load defines the forces associated with the mass of the empty mill including liners.
- The Drive Load defines the forces associated with the transmission of torque through the drive train during normal operation. The Drive Load has a continuous component and a dynamic component. The continuous component defines the constant force transmitted through drive train and the dynamic component defines the fluctuating forces caused by the gear meshing. The dynamic load variations occur at the gear meshing frequency.
- The Drive Load – Start-up column defines forces associated with the gearless mill drive during start-up at trip level motor eccentricity / air gap reduction.
- The Drive Load – Operation column defines forces associated with the gearless mill drive during operation at trip level motor eccentricity / air gap reduction.
- The Drive Load – Short Circuit column defines forces associated with the gearless mill drive during a motor short circuit event.

- The Charge Load defines the forces associated with the mass of the charge and has a continuous component and a dynamic component. The continuous component defines the static weight force of the charge and the dynamic component defines the fluctuating forces due to the mass of material carried by each lifter. The charge dynamic variations occur at the lifter passing frequency.
- The Startup Forward Load defines the forces associated with the transmission of torque through the drive train as the mill is accelerated from stationary to normal operating speed in the forward rotation direction.
- The Startup Reverse Load defines the forces associated with the transmission of torque through the drive train as the mill is accelerated from stationary to normal operating speed in the reverse rotation direction.
- The Inching Forward Load defines the forces associated with the transmission of torque through the drive train as the mill is inched in the forward rotation direction. There is a Left and Right column as the inching drive can be located on either side.
- The Inching Reverse Load defines the forces associated with the transmission of torque through the drive train as the mill is inched in the reverse rotation direction. There is a Left and Right column as the inching drive can be located on either side.
- The Seismic Load defines the additional reaction forces from the mill onto the main bearings caused by a seismic event.
- The brake stopping force defines loads associated with braking the mill.

3.0 INSTRUCTIONS FOR FOUNDATION DESIGN

Notes:

1. The occurrence of vibrations must be considered during the design of the supporting structure.
2. Outotec strongly recommends the use of concrete foundations to minimise the possibility of excessive vibration (steel structures are difficult to design to achieve the vibration limits stated herein).
3. Unless otherwise stated in the Contract the mill Purchaser is responsible for the foundation design and dimensions, subject to dimensional limits nominated herein.
4. The foundation design must take into account strata conditions taken from repeatable and reliable geotechnical surveys

Design:

The Engineer must model the foundation system, including the whole structure and strata, based on the load cases listed below in Table 1 – Gear Drive Mills and Table 2 – Gearless Drive Mills:

Load Cases	**Concurrent Loads**
Stationary Mill, Empty	Dead Load
Stationary Mill, Design Charge	Dead Load + Charge Load
Normal Operation	Dead Load + Charge Load + Drive Load
Startup Forward Direction	Dead Load + Charge Load + Startup Forwards
Startup Reverse Direction	Dead Load + Charge Load + Startup Reverse
Inching Forward (Note A)	Dead Load + Charge Load + Inching Forward
Inching Reverse (Note A)	Dead Load + Charge Load + Inching Reverse
Seismic	Dead Load + Charge Load + Seismic
Note A:	Inching loads (both forward and reverse) apply only to the pinion used for inching (typically called the 'A' pinion).

Table 1: Load cases and corresponding concurrent loads as detailed on foundation load drawing for gear drive mills

Load Cases	**Concurrent Loads**
Stationary Mill, Empty	Dead Load
Stationary Mill, Design Charge	Dead Load + Charge Load
Normal Operation	Dead Load + Charge Load + Drive Load - Operation
Startup	Dead Load + Charge Load + Drive Load - Startup
Motor Short Circuit	Dead Load + Charge Load + Drive Load – Motor Short Circuit
Seismic	Dead Load + Charge Load + Seismic
Braking	Dead Load + Charge Load + Brake Stopping Force

Table 2: Load cases and corresponding concurrent loads as detailed on foundation load drawing for gearless drive mills

Under all load cases the foundation must achieve:

1. Lower than maximum concrete stresses
2. Lower than maximum ground bearing pressures
3. Maximum vibrations anywhere in the mill foundations of less than 5mm/s RMS *(Seismic and motor short circuit load cases excluded)*
4. Not more than 200 microns of differential longitudinal movement between the mill's main bearing pedestals (piers). *(Seismic and motor short circuit load cases excluded)*

Additional concrete / reinforcements must be added until the above limits are met.

4.0 TECHNICAL NOTES

4.1 It is very important that the connection of the foundation to the underlying strata is accurately modeled, as the Mill Supplier has found in many past cases of high foundation vibration the root cause has been the inaccurate modeling of the strata connection.

4.2 For the purposes of modeling Outotec suggests torques and loads are applied to the foundation as follows:

1. Torques nominated as occurring around the mill centre line or shaft centerlines should be applied to the foundation hold down bolts against which they will act via rigid links.
2. Horizontal forces nominated as occurring at the top of pedestals should be transferred to the foundation by conversion of the loads to equally distributed surface pressures applied to the appropriate shear key recess area (depth times width) through which the forces will be transferred.
3. Vertical up forces nominated as occurring at the top of pedestals should be applied to the foundation hold down bolts against which they will act via rigid links.
4. Vertical down forces nominated as occurring at the top of pedestals should be transferred to the foundation by conversion of the loads to equally distributed surface pressures applied to the appropriate base plate area (length times width) through which the forces will be transferred.

Having said this the Engineer needs to apply current best practice to the torque and load application to ensure accurate analysis.

4.3 There are no specific additional start up or inching foundation limits.

4.4 Where multiple mills are involved:

- Foundation split lines should be incorporated between individual mill foundations to reduce induced vibration between mills.
- The rotation direction of adjacent mills, particularly geometrically similar mills, should alternate clockwise / anticlockwise. It is understood this is not always practical and if not efforts need to be made to reduce adjacent mill vibrations compounding between each other.

4.5 The mill design is quite tolerant of post installation settlement:

1. Max allowed differential settlement between the different mill items (mill's main bearings, motor, etc) delta s= 0,5 mm. More maybe acceptable subject to Outotec review.
2. Max allowed differential settlement between equipment connected to the mill (conveyors, pump sumps, etc.) and the mill is 5 mm, but adjustments maybe required to accommodate this amount.
3. Max allowed inclination delta s / L = 0,3 mm/m.

Key considerations in respect to settlement that occurs during installation, commissioning and operation are as follows:

- where that settlement affects the pinion contact, hot alignment will be needed (as is recommended post commissioning),
- where the settlement affects feed seal alignment the feed chute alignment may need adjustment,
- post settlement the induced vibration from the dynamic process loads must not exceed 5mm/s RMS and
- post settlement the displaced foundations must not induce interference between stationary and rotating sections of the mill. This must be considered on a case by case basis.

4.6 Earthquake loads can be significant and the Engineer must take these into account when designing the foundation / reinforcements. In particular the Mill Supplier supplied shear keys must be installed into block outs in the concrete so as to not rely on the grout bond strength to transfer the seismic loads. The foundation steel reinforcing must surround these block outs so the shear keys are enclosed in the horizontal plane by the reinforcing

4.7 In conclusion there are many pit falls associated with foundation design. The paper, "Considerations for Grinding Mill Foundations.pdf" provides a good, practical wrap up of some of the issues discussed herein. This paper is in the 2014 SME Proceedings and can be provided by Outotec on request.

Summary

The main purpose of this dynamic analysis is to investigate if the system natural modes with the dynamic loads would result in vibration levels exceeding 7.07 mm/s peak and differential longitudinal displacements between the main bearing pedestals exceeding 200 microns. Two sets of analyses are done considering lower and upper values of shear modulus of foundation rock. Modal analysis as well as harmonic analysis is performed in order to determine the steady-state response of the structure due to the drive and dynamic charge loads. The maximum peak vibration level for the x, y and z directions over the forcing frequency ranges of 3.64 – 10.49 & 44.29 - 58.89 Hz is computed in the finite element model. The absolute maximum peak vibration level computed for two frequency ranges in the x, y and z directions are 0.83, 3.05, 1.00 & 0.507, 3.79, 1.73 mm/s respectively with lower limit and 0.514, 1.93, 0.730 & 0.663, 5.59, 0.976 mm/s respectively with upper limit. Vibration levels in the system are within 7.07 mm/s peak velocity, hence foundation is in safe zone. Differential displacements between the main bearing pedestals are computed 100 & 60.6 microns for lower & upper limits respectively considering all adverse conditions, which is also within the safe limit of 200 micron.

1. Introduction

This report is a verification of the Ball Mill Foundation system, subject to a range of sinusoidal loading conditions using finite element analysis [1]. Present computational model has been made closer to the actual physical system than the earlier model by inclusion of different layers of rock below the foundation raft and mill between the two main bearing pedestals with frictionless contact along the axial direction at feed end pedestal. Considering uncertainty of the supporting rock properties, two set of analyses are performed with upper and lower limits of the properties as per ACI 351.3R-18 A.2.

The main purpose of this analysis is to investigate:

- Undamped modal behavior to check with the excitation frequencies of the ball mill.
- Steady state dynamic behavior of the system with harmonic analysis to ensure that potential excitation forces will not cause vibration that might jeopardize safe operation of the equipment.

Two modal analyses are performed considering lower and upper limits of rock properties. Inclusion of mill between two main bearing pedestals removed some of the lower modes coming from individual pedestals, which were shown in the earlier report. The harmonic analyses are performed in order to determine the steady-state response of the structure due to the drive and dynamic charge loads.

2. Design Basis

2.1. Geometry

Ball Mill Foundation system consists of the foundation rock, raft and different pedestals shown in Figure 1.

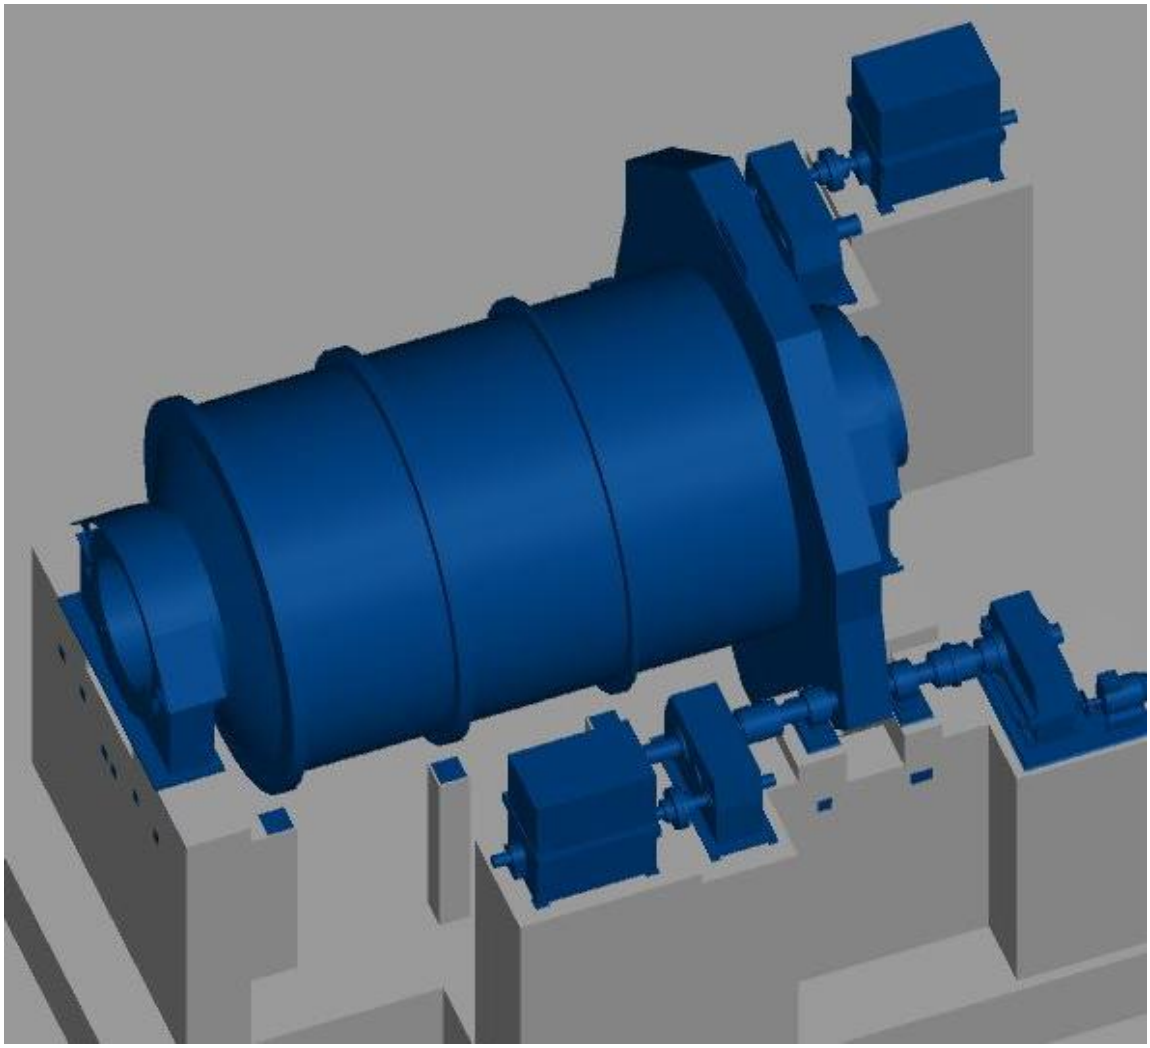

Figure 1. Solid model of Foundation system and Ball Mill

2.2. Material Properties

The material properties of foundation concrete shown in Table 1.

2.3. Lump Mass Modelling

Mass model other than Mill is considered as equivalent amount mass of structural steel for simplification of the model in finite element analysis. Modelling is done taking information from load data given by equipment manufacturer shown F1 to F21, F26 loading as follows:

- Model of Mill Main Bearing Feed End (F1, F2, F3)
- Model of Mill Main Bearing Discharge End (F4, F5, F6)
- Model of Pinion, Gear Guard (F7, F8, F9, F10, F11, F12, F26)
- Model of Pinion, Gear Guard (F13, F14, F15, F16, F17, F18, F26)
- Model of Main Motor, Gear Box (F19, F20)
- Model of Inching Drive (F21)

Mass of mill in earlier model was modelled with two lumped masses- one for feed and other for discharge end. These lumped masses are removed in the present model as mill is modelled explicitly. The material properties of mill and other components are considered as structural steel and listed in Table 2.

2.4. Mill Model

Mill is modelled to match the static reaction forces of the mill in feed and discharge ends with the load given in the load data drawing provided by the equipment manufacturer (shown in Table-3).

3.3. Drive Loadings

Components of drive forces are taken from drawing provided by equipment manufacturer. Continuous component has no effect in dynamic analysis, so ignored in current analysis. Dynamic component is applied in the respective parts of the system with zero phase and at gear mesh frequency (44.29 – 58.89 Hz).

3.4. Charge Loadings

Components of charge loads are taken from drawing provided by equipment manufacturer. Continuous components are considered as mass in dynamic analysis. Dynamic components are applied in the respective parts of the system with zero phase and at lifter passing frequency (3.64 – 10.49 Hz). Two different FRF analysis is done, one for loading in lateral (YY) direction and other for loading in vertical (ZZ) direction.

4. Analysis

Main purpose of the analysis is to ensure:

- Differential displacement between main pedestals within 200 microns.
- RMS velocity limit of the foundation within 5 mm/sec, which is 7.07 mm/sec peak velocity.

4.1. Modal Analysis

A modal analysis is performed in order to determine the natural frequencies and mode shapes of the system. The purpose is to investigate if any natural modes would occur at potential excitation frequencies such as the gear mesh frequencies or lifter frequency range.

4.2. Harmonic Analysis

Harmonic analysis is performed in order to determine the steady-state response of the structure subject to the dynamic drive and charge loads. The main purpose is to investigate if the natural modes identified in section 4.1 would result in vibration levels exceeding 5.0 mm/s RMS when subject to the dynamic load. Damping of 5% is considered for dynamic analysis, shown in Table 7.

Table 7. Damping properties for harmonic analysis

Harmonic analysis of the model provides the response of a system for any sinusoidal loading. Such analyses for a range of frequencies is called frequency response analysis. Plots of different quantities (displacement, velocity, etc.) vs such frequency ranges are called frequency response functions (FRF).

Harmonic analysis of the model is divided into three load cases:

- Drive load: Gear Mesh Frequency 44.29-58.89 Hz
- Charge YY load: Lifter Passing Frequency 3.64-10.49 Hz
- Charge ZZ load: Lifter Passing Frequency 3.64-10.49 Hz

5. Results

5.1. Modal Analysis

Table 8a & 8b and Figure-13 shows first 50 natural modes in the range 7.66 – 62.31 Hz and 8.23 – 83.46 Hz for lower and upper limits of the rock properties, respectively. As shown in bold font several modes occur inside the lifter passing and gear mesh frequency ranges. In order to verify the safe condition of the system at these frequencies, harmonic response analyses are to be performed. First 6 mode shapes are shown in Appendix.

6. Conclusions

The maximum peak vibration level for the x, y and z directions over the excitation forcing frequency ranges of 3.64 – 10.49 & 44.29 - 58.89 Hz is computed in the finite element model. The absolute maximum peak vibration level computed for two frequency ranges in the x, y and z directions are 0.83, 3.05, 1.00 & 0.507, 3.79, 1.73 mm/s respectively with lower limit and 0.514, 1.93, 0.730 & 0.663, 5.59, 0.976 mm/s respectively with upper limits. Differential displacements between the main bearing pedestals is computed 100 & 60.6 microns for lower & upper limits respectively considering all adverse conditions.

Vibration levels in the system are within 7.07 mm/s peak velocity, hence foundation is in safe zone. Differential displacements between the main bearing pedestals are also within the safe limit of 200 micron.
